Introduction

In today's dynamic financial environment, individuals invest in multiple asset classes such as stocks, mutual funds, gold, and other instruments. However, managing these investments efficiently remains a major challenge. Investors often rely on spreadsheets, manual records, or multiple platforms to track their assets, which can be time-consuming, error-prone, and inefficient. The lack of a unified system to monitor overall financial health frequently leads to delayed decision-making and missed market opportunities. To address this problem, the Portfolio Tracker is developed as a centralized, intelligent, and user-friendly web application that enables individuals to manage all their investments in one secure platform.

The primary objective of the Portfolio Tracker is to simplify and enhance the investment management experience. The system eliminates scattered record-keeping by consolidating all financial assets into a single dashboard. It provides users with real-time portfolio valuation, profit and loss summaries, and performance analytics. In addition to passive monitoring, the system introduces proactive investment management through smart price alerts. Users can define target prices for specific assets, and automated email notifications are triggered when those thresholds are reached, ensuring timely decision-making even when users are not actively monitoring the application.

The scope of the project includes secure user authentication, portfolio transaction management, real-time price monitoring, and interactive data visualization. Users can register and log in securely, add or manage investment transactions, and view detailed analytics of their portfolio performance. The system integrates market data APIs for price tracking and utilizes graphical dashboards to present insights clearly. However, the project does not include automated trading, brokerage integration, or tax computation, as its focus is strictly on tracking, analysis, and alerts within a self-managed environment.

The motivation behind this project arises from the growing need for accessible and affordable investment tracking tools for everyday investors. Many existing financial platforms are either complex, expensive, or limited in functionality. This project applies core software engineering principles such as requirement analysis, modular design, implementation, and testing to build a practical and scalable solution. The system is built using a modern technology stack including React.js with Vite for frontend development, Firebase Authentication and Firestore for backend services and data storage, and Recharts for interactive data visualization. Version control and collaboration are managed through GitHub.

In conclusion, the Portfolio Tracker is a well-defined, secure, and user-centric web application designed to provide investors with real-time insights, automated alerts, and comprehensive portfolio management capabilities. It offers a streamlined solution to modern investment tracking challenges while maintaining simplicity, security, and usability at its core

Page 1 – Login Screen

This is the **authentication interface** of the Portfolio Tracker application. It allows users to securely sign in using Google authentication. The minimal design ensures quick access while maintaining user trust and security.

Page 2 – Dashboard Overview

This screen displays the **main dashboard** showing account overview metrics such as invested amount, current value, and total returns. When no data is available, users can load sample data to explore system functionality, when user logs in for the first time he/she can try the option for loading the data. The layout provides a clear summary of financial performance.

Page 3 – Dashboard with Data & Asset Allocation

This view presents a populated portfolio dashboard with real-time financial metrics. This is the sample data which will be reset on re Log in or refresh. The **portfolio allocation pie chart** visually represents distribution across asset types such as stocks, mutual funds, and gold. The asset summary table provides a structured breakdown of cost, value, and returns.

Page 4 – Portfolio Notes Feature

This screen shows the **Portfolio Notes modal**, allowing users to record investment-related notes and strategies. It helps users track observations such as diversification, risk factors, and performance insights. This enhances decision-making and financial planning.

Page 5 – Stocks Holdings Page

This interface displays detailed **stock holdings information**, including units, cost price, current price, total value, and returns. It enables users to monitor individual stock performance clearly. The structured tabular layout improves readability and quick comparison. It also shows history of previous transactions of any stock made till now.

Page 6– Performance Comparison (Stocks)

This screen presents a **performance comparison graph** showing portfolio growth over time. Users can switch between time ranges (1M, 3M, 1Y, etc.) to analyze trends. The interactive line chart helps visualize returns and market performance changes.

Page 7 – Gold Holdings Page

This page displays detailed information about **gold investments**, including digital gold and physical jewelry. It shows weight, cost, current market value, and return percentage. The page helps users track commodity-based investments separately from equities.

Page 8 – Multi-Asset Performance Comparison

This screen compares performance across different asset classes such as Nifty, Sensex, Mutual Funds, Stocks, and Gold. The multi-line chart allows users to evaluate portfolio growth relative to market benchmarks. It supports better strategic investment decisions.

Page 8 - Manage Transactions – Add New Holding

This screen allows users to add a new investment transaction by selecting the asset category and entering details such as symbol, quantity, price, and date. The form ensures structured data entry with required fields and validation controls. It enables accurate portfolio tracking by securely recording buy transactions.

User Stories for Portfolio Tracker Platform

ID	User Role	Wants To	So That
US001	User	register using email and password	securely access the platform
US002	User	log in and log out securely	access personal portfolio data
US003	User	add investment details (asset name, quantity, buy price, date)	track all my assets in one place
US004	User	edit or delete an existing investment record	maintain accurate and up-to-date records
US005	User	view real-time asset prices fetched via API	monitor live market performance
US006	User	see automatic profit and loss for each holding	evaluate individual asset gains and losses
US007	User	view the total portfolio value in real time	understand my overall investment growth
US008	User	set a target price alert for any asset	be notified when the price hits my threshold
US009	User	receive email notifications for price alerts	react quickly to significant market changes
US010	User	get AI-based investment recommendations	improve my portfolio strategy intelligently
US011	User	write and save personal investment notes	record insights and reasoning for each trade

ID	User Role	Wants To	So That
US012	User	load pre-built test/demo data into the platform	explore all features without entering real data
US013	User	view interactive charts and graphs of my portfolio	analyse asset distribution and growth visually
US014	User	access the platform on any mobile or desktop device	manage my investments conveniently anywhere
